

SNEAKER HUB WEBSITE

Step-by-Step Procedure for Creating and Applying External CSS

1. Open Visual Studio Code

Open Visual Studio Code (VS Code) on your computer.

Click File and select Open Folder.

Create a new folder called “Sneaker Hub”.

Select the folder and click Select Folder.

Your VS Code workspace will now be connected to the Sneaker Hub project folder.

2. Create the HTML Pages

In the Sneaker Hub folder, create these HTML files:

1. index.html
2. about us.html
3. services.html
4. products.html
5. contact us.html
6. thank you.html

To create a file, use the Explorer on the left side of VS Code, click New File, type the filename, and press Enter.

3. Create the Welcome Page

Open index.html and paste your Welcome page HTML code into the file.

The page should contain the Sneaker Hub heading, welcome message, navigation menu, introduction, sneaker image, link to the Products page, and footer.

4. Create the External CSS File

In VS Code, go to the Explorer and click New File.

Name the file style.css.

Do not name it style.html.

The style.css file will contain the styling for all Sneaker Hub pages.

5. Add CSS Styling

Open style.css and add the CSS rules for the body, header, navigation, main content, images, product cards, service cards, contact form, thank-you page, footer, and mobile responsive design.

The CSS file controls the appearance of the website while the HTML files control the structure and content.

6. Link the CSS File to the HTML

Inside the <head> section of every HTML page, add the following line:

```
<link rel="stylesheet" href="style.css">
```

This tells the browser to use the styling in the external style.css file.

Because the CSS file is in the same folder as the HTML files, the browser can find it using href="style.css".

7. Create the About Us Page

Open about us.html and add information about Sneaker Hub.

Include sections such as About Sneaker Hub, Our Mission, and Our Vision.

Make sure the <head> contains the external CSS link.

8. Create the Services Page

Open services.html and add the services offered by Sneaker Hub.

Examples include Sneaker Sales, Delivery, and Customer Support.

Use the service-card CSS class if you are using the provided stylesheet.

9. Create the Products Page

Open products.html and display the sneakers available from Sneaker Hub.

Each product can contain a product image, product name, description, and price.

Use the products and product-card CSS classes to create a neat product-card layout.

10. Create the Contact Us Page

Open contact us.html.

Add the company contact information, such as email, phone number, and location.

You can also add a contact form with fields for full name, email, and message.

Set the form action to thank you.html so that the user is taken to the Thank You page after submitting the form.

11. Create the Thank You Page

Open thank you.html.

Add a thank-you message explaining that the customer's message has been received.

Add a link that allows the user to return to the Welcome page.

Make sure the page is also linked to style.css.

12. Save All Files

Open each file and press Ctrl + S to save it.

Your folder should contain all six HTML files and the style.css file.

13. Test the Website

Open index.html in a web browser.

You can right-click index.html and choose Open with a browser.

If you have the Live Server extension installed in VS Code, you can right-click the HTML file and select Open with Live Server.

14. Check the External Styling

Check that the header has a dark background.

Check that the navigation links are visible.

Check that the main content appears correctly.

Check that the sneaker image is displayed.

Check that the footer has a dark background.

Check that product cards and service cards are styled.

Check that the contact form is styled.

15. Test the Navigation Links

Click Welcome, Products, Services, About Us, Contact Us, and Thank You.

Each link should open the correct HTML page.

For example, `<a href="products.html">Products</a>` opens products.html.

16. Check the CSS Link if Styling Does Not Work

Make sure the CSS file is named exactly style.css.

Make sure every HTML page contains `<link rel="stylesheet" href="style.css">` inside the `<head>` section.

Make sure style.css is in the same folder as the HTML files.

Save all files with Ctrl + S and refresh the browser.

17. Understanding How External CSS Works

External CSS means that the styling is kept in a separate CSS file instead of being written inside every HTML page.

HTML controls the content and structure of the website.

CSS controls the appearance and design of the website.

For example, `<h1>SNEAKER HUB</h1>` creates the heading, while an h1 CSS rule can change its font size and appearance.

18. Advantages of Using External CSS

Consistent Design: all Sneaker Hub pages can have the same design.

Less Repeated Code: the same CSS does not need to be written on every page.

Easy to Update: changing style.css can update the appearance of all pages.

Professional Structure: separating HTML and CSS is a standard web-development practice.

Easier Maintenance: it is easier to find and change styling when CSS is stored in one file.

19. Final Website Structure

Sneaker Hub/

index.html — Welcome Page

products.html — Products Page

services.html — Services Page

about us.html — About Us Page

contact us.html — Contact Us Page

thank you.html — Thank You Page

style.css — External Website Styling

20. Final Checklist

- ☐ index.html works.
- ☐ products.html works.
- ☐ services.html works.
- ☐ about us.html works.
- ☐ contact us.html works.
- ☐ thank you.html work.
- ☐ style.css is included.
- ☐ Every HTML page is linked to style.css.
- ☐ Navigation links work.
- ☐ Images display correctly.

- ☐ Contact form works.
- ☐ Website styling appears correctly.
- ☐ All files are saved.
- ☐ Website has been tested in a web browser.

Conclusion

The Sneaker Hub website is created using HTML for the structure and an external CSS file for the design. The main procedure is to create all the HTML pages, create one style.css file, link the CSS file to every HTML page, add the required content and styling, and finally test all pages and navigation links in a browser.
